Q1.

Mirror formula: $\frac{1}{v} + \frac{1}{u} = \frac{1}{f}$

where v = image distance, u = object distance, f = focal length of the mirror.

Q3.

Excretion is the process of removal of metabolic waste from the body. In humans, the kidneys filter blood to remove urea and other wastes, which are then excreted as urine through the ureters, bladder and urethra.

Q2.

Limitations of Mendeleev's table -

- (i) position of hydrogen was uncertain.
- (ii) isotopes were not given separate places.
- (iii) some elements with similar properties were placed apart, and dissimilar elements grouped together.

Q6.

(a) Valency is the combining capacity of an element, based on the number of electrons in the outermost shell.

(b) Across a period, valency w.r.t. hydrogen first increases from 1 to 4 and then decreases to 0 zero.

Q4.

In double circulation, blood passes through the heart twice in one complete cycle - once through the pulmonary circulation (heart to lungs and back) and once through the systemic circulation (heart to body and back). This keeps oxygenated and deoxygenated blood separate.
